

## Water-Wise Plants

# Trees & Ornamentals For South Central Kansas

List is developed / coordinated by Sedgwick County – K-State Research & Extension, with major input from K-State research and observation by horticulturists and landscape architects in the Wichita area.

The following plants are adapted to south central Kansas. All require watering until well-rooted and established. This may take one to two years or more, depending on the type and size of plants, site characteristics, and other factors. Our 'water-wise' designation means a plant will survive on natural rainfall in our area, but may need to be watered *at most* once every two weeks **after establishment** to retain its aesthetic characteristics.

When selecting plants adapted for our prairie climate, we must realize that while most soils are well-drained and rather dry, lower areas and drainage areas are moist to wet sites with different plants that either thrive or fail. Some will not tolerate moist to wet sites that may remain saturated with water for several days at a time. Plants that do not tolerate wet sites are preceded by \*

An adapted plant list expands considerably when adding plants that are watered regularly. This plant list is for gardeners that are searching for plants to survive on natural rainfall, or with infrequent supplemental watering.
